Bài 1: Tạo trang login trong ASP.NET MVC với Entity Framework Code First

- Ghép giao diện trang login vào hệ thống
- Tạo mới Login Model
- Tạo tầng Models và cài đặt Entity Framework
- Tạo tầng Code first bằng Entity Framwork tool for Visual
- Tao view Login bằng HTML Razor
- Login và thông báo lỗi bằng Razor

Chuẩn bị:Project của bài 04:

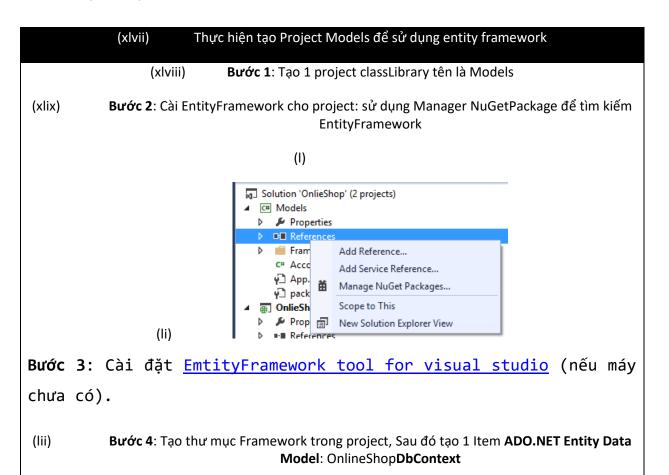

Database:

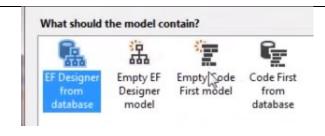

```
CREATE DATABASE WebShopHocTap
              (i)
                        (ii)
                                 go
                          USE [WebShopHocTap]
                  (iii)
                        (iv)
                                GO
        (v)
                           SET ANSI_NULLS ON

                                         SET ANSI_NULLS ON
                                    (xxvi)
                                               GO
                          (xxvii)
                                     SET QUOTED_IDENTIFIER ON
```

```
(xxviii)
                             GO
(xxix)
             CREATE PROC [dbo].[SP_Account_Login]
    (xxx)
                   @UserName VARCHAR(20),
     (xxxi)
                    @PassWord VARCHAR(20)
                 (xxxii)
                             AS
              (xxxiii)
                             BEGIN
      (xxxiv)
                       DECLARE @count INT;
       (xxxv)
                        DECLARE @res BIT;
   (xxxvi)
                    SELECT @count = COUNT(*)
      (xxxvii)
                       FROM dbo.Account
(xxxviii)
                 WHERE UserName = @UserName
(xxxix)
                     AND PassWord = @PassWord;
         (xl)
                          IF @count > 0
         (xli)
                            SET @res = 1;
              (xlii)
                               ELSE
         (xliii)
                            SET @res = 0;
        (xliv)
                         SELECT @res;
               (xlv)
                             END;
                (xlvi)
                             GO
```

Thực hiện:

- Tạo 1 chuỗi kết nối bằng winzad để tạo chuỗi kết nối.
- Sau khi tạo xong, thì entity code first sẽ tự động tạo ra mỗi bảng sẽ là 1 Entity, và các class của database.

(liii)

(liv) **Bước 5:** Tạo lớp AccountModel để thực hiện lấy kết quả từ thủ tục kiểm tra đăng nhập

```
public class AccountModel : IDisposable
{
    private OnlineShopDbContext context = null;
    public void Dispose()
    {
        if (context != null)
            {
             context.Dispose();
                context = null;
            }
        public AccountModel()
        {
             context = new OnlineShopDbContext();
        }
        public bool Login(string UserName, string Password)
        {
             object[] Sqlparams = new SqlParameter[]{
```

```
new SqlParameter("@UserName", UserName),
                  new SqlParameter("@Password", Password)
              };
              var res = context.Database.SqlQuery<bool>("SP_Account_Login")
@UserName,@PassWord", Sqlparams).SingleOrDefault();
              return res;
                                         (lv)
                       Tạo Class để lưu trữ Session trong đường dẫn Area/admin/codes
          (Ivi)
                                          (Ivii)
                                   (Iviii)
                                                  [Serializable]
                              (lix)
                                            public class UserSession
                                         (lx)
                                        public string UserName { set; get; }
                       (lxi)
                                         (lxii)
                              (lxiii)
                                          public class SessionHelper
                                         (lxiv)
                (lxv)
                                 public static void SetSession(UserSession session)
                                        (lxvi)
                                                        {
             (lxvii)
                                HttpContext.Current.Session["LoginSession"] = session;
                                        (lxviii)
                      (lxix)
                                       public static UserSession GetSession()
```

```
(lxx)
        (lxxi)
                            var session = HttpContext.Current.Session["LoginSession"];
                              (lxxii)
                                                 if (session == null)
                                                      return null;
                                (lxxiii)
                                     (lxxiv)
                                                         else
                                      (lxxv)
                      (lxxvi)
                                            return session as UserSession;
                                      (lxxvii)
                                       (lxxviii)
                                        (lxxix)
                                   Tạo Controller có tên là LoginController
                      (lxxx)
                                     (lxxxi)
